**making intelligent processes work**

## Challenge

Managing contracts manually presents significant challenges for organizations. Employees often spend extensive amounts of time searching for specific information within lengthy contract documents. Even with the assistance of a contract registry application that streamlines searching, the process of extracting data and inputting it into the system remains labor-intensive. Additionally, no existing application can capture every detail contained within a contract, necessitating manual searches to obtain all necessary information.

## Solution Description

The solution centers around a contract registry application that automatically stores all essential contract information. This is accomplished using AI, which extracts and organizes details from unstructured contract documents without manual input. Users can assign tasks to other departments or individuals and can efficiently search for contract details within the registry. For more in-depth inquiries, users can interact with an AI agent using natural language, enabling a seamless and intuitive experience.

## Advantages

- ✓ **Enhanced Productivity:** The application enables rapid data extraction with minimal user intervention, including through chat-based interactions.
- ✓ **Data Integrity:** Consistency and accuracy are maintained through a fully automated and repetitive process, supported by configurable rules within the contract registry application.
- ✓ **Efficient Reporting and Search:** Structured data and chat-based search functionality accelerate reporting and data retrieval.
- ✓ **Secure Administration:** The system safeguards against data loss by ensuring secure management of contract information.
